

## Test data | Part B

In one day, a person can work a minimum of 0 hours, or a maximum of 24 hours. To do an in range test, I would type in any number within the range of 0 and 24. For example, I might type in 2. My expected result is that the system should output the value of £10 as  $5 \times 2$  is 10. To do an out of range test I would type in any number outside the range of 0 and 24. For example, I might type in 30. The system, if properly coded, should produce an error message which tells me that what I've typed in is outside the accepted range.
